

Supplementary File 1: Time-lapse observation of lupin seed maturation.

We monitored the drying process of lupin seed, from harvest until complete dryness, under a dissecting microscope (see Materials and Methods for details) by capturing a photo every 20 minutes. This showed that the drying of seed during maturation is a very rapid process occurring within few hours from harvest. Link to a movie made from the running shots made under the binocular: <https://youtu.be/ijt8zqwrMI0> .
