

Fig. S1: Proof-of-principle RMCE experiment with different mCherry constructs confirmed functionality of puromycin enrichment and poly(A) trap. A: Tunable expression patterns were generated depending on promoter type preceding mCherry. The MFI of mCherry in Q1 of each panel indicates strength of the promoter. B: Target band size by 5' junction PCR was 1-2 kb or over 2kb (CMV) depending on promoter size; target band size by 3' junction PCR was ~1 kb.
