

Fig. S1 The relative biomass allocation between leaf, shoot and root in *Fraxinus mandshurica* and *Pinus koraiensis*. The lower-case letters on the bars represent significant differences within each organ, between all six combinations, tested with Tukey post-hoc test. Difference between species were showed below each sampling time. > or < means significant difference, ns showed no significant, for leaf at S3 (Jan, 2018), NA for no comparable leaf data for test.
