

Supplementary Figure S2. Different patterns of shoot regeneration from sweet orange epicotyl explants cultured on various shoot regeneration media. (a) Single shoot induction from an epicotyl explant, (b) clustered shoot formation; (c) shoot formation from both ends of an epicotyl explant, (d) callus formation at one end with shoot induction at the opposite end, (e-g) callus formation without shoot regeneration: (e) callus formed at both ends, (f) callus formed at one end, and (g) callus covering the entire epicotyl explant. Black arrows indicate regenerated shoots, while red arrows indicate callus. Scale bar = 0.5 cm.
