

**Supplementary Fig. S4 . Wet biomass of (a) whole plant (whole radish plant) and (b) bulb grown in contaminated soil without and with BC amendments.**

The control (Cntrl) represents the plant grown in PROmix pot mix. Error bars represent the standard errors for each treatment ( $n = 5$ ). Different small letters depict significant variation in wet biomass of whole plant and bulb along biochar amended soil with and without Fe fortification as compared to unamended soil (ANOVA,  $p \leq 0.05$ );

\*\* Significant variation in the wet biomass between unamended soil and biochar amended soil (t-test,  $p \leq 0.05$ ); NSD- No significant difference
